2.2 – Empathy Map Canvas

The Empathy Map Canvas is a tool used to understand the needs, thoughts, feelings, challenges, and expectations of stakeholders involved in agriculture, especially farmers, policymakers, researchers, and agricultural organizations. It helps in analyzing agricultural crop production from the users' perspective and supports better decision-making through data-driven insights.

Says

Farmers and agricultural stakeholders often express the need for higher crop production, better market prices, improved irrigation facilities, and timely weather information. They emphasize the importance of government support, quality seeds, fertilizers, and modern farming techniques to increase productivity and reduce losses.

Thinks

They think about selecting the most profitable crops, improving crop yield, reducing cultivation costs, and managing risks caused by climate change, pests, and diseases. They also consider how technology and data analysis can help them make better farming decisions

Does

Farmers prepare land, sow seeds, apply fertilizers, irrigate fields, and monitor crop growth throughout the season. They use agricultural information from experts, government schemes, and market reports to improve farming practices. Many are gradually adopting modern technologies and data-driven approaches to increase efficiency.

Feels

Farmers often feel concerned about unpredictable weather, water shortages, rising input costs, and fluctuating market prices. At the same time, they remain hopeful that improved agricultural practices, government support, and technological advancements will help them achieve better yields and higher income.

Pains

The major challenges include irregular rainfall, climate change, pest attacks, crop diseases, lack of irrigation facilities, high production costs, and unstable market prices. Limited access to advanced technology and reliable agricultural data also affects productivity and decision-making.

Gains

By using agricultural data analysis, farmers and policymakers can identify production trends, optimize resource utilization, improve crop selection, increase yield, and enhance profitability. Better planning and informed decision-making contribute to sustainable agriculture, food security, and economic growth.

Hears

Users hear recommendations from agricultural officers, government agencies, market experts, and fellow farmers regarding crop selection and farming techniques. They also receive updates about government schemes, weather forecasts, and market demand, which influence agricultural decisions.
