

India's Agricultural Crop Production Analysis.

TEAM ID	SWTID-2026-8827
PROJECT TITLE	India's Agricultural Crop Production Analysis.
MAX MARKS	2 MARKS

3.2 – Solution Requirement

The Indias Agricultural Crop Production Analysis project needs a solution that uses data to help people make decisions. This solution should collect data process it analyze it and show it in a way that is easy to understand. It should give us information about how crops are produced how different states are doing, what the yield patterns are and where crops are being grown. We should be able to see all this information in dashboards and reports.

Functional Requirements

1. We need to get crop production data from government or public datasets that we can trust.
2. We have to clean up the data by getting rid of missing values and duplicates.
3. We have to analyze how crops are produced based on the state, district, type of crop, season and year.
4. We need to compare how much is produced how much land is used and what the yield is in regions.
5. We have to find out which states and crops are doing the best by using indicators.

India's Agricultural Crop Production Analysis.

6. We should be able to see charts, maps, filters and dashboards that make it easy to analyze the data.
7. We need to make reports that will help people who make policies researchers and farmers make decisions.

8. Technical Requirements

9. We will get our data from agricultural production datasets that're available to the public in formats like CSV, Excel or government open data.
