

India's Agricultural Crop Production Analysis.

TEAM ID	SWTID-2026-8827
PROJECT TITLE	India's Agricultural Crop Production Analysis.
MAX MARKS	5 MARKS

CHAPTER – IV PROJECT DESIGN

4.1 – Problem Solution Fit

The agricultural sector in India generates a vast amount of crop production data from different sources, making it difficult to manage and analyse effectively. This project addresses the problem by collecting, cleaning, and integrating the data into a single Tableau dashboard, providing a centralized platform for analysis and easy access to information.

Another major challenge is that farmers, researchers, and policymakers often find it difficult to identify production trends over different years. To solve this issue, the project uses interactive line charts and trend analysis visualizations that help users understand yearly changes in crop production and identify growth or decline patterns.

Comparing crop production across different states is also a time-consuming task when using traditional reports. The solution is to develop state-wise maps and bar charts in Tableau, allowing users to compare production levels quickly and identify the highest and lowest producing states with ease.

Manual analysis of large agricultural datasets is prone to errors and consumes significant time. By automating data visualization and reporting through Tableau dashboards, the project enables faster, more accurate, and data-driven decision-making for agricultural planning.
